

AIM: Create a HTML page using heading tags.

DESCRIPTION:

- A HTML heading tag is used to define the headings of a page.
- There are 6 levels of headings defined by HTML.
- H1 being the highest level and H6 being the least.

SYNTAX:

```
<h1>...content.....</h1> <h2>...content.....</h2> <h3>...content.....</h3>  
<h4>...content.....</h4> <h5>...content.....</h5> <h6>...content.....</h6>
```

PROGRAM:

```
<html>  
<head>  
<title>Heading Tags</title>  
</head>  
<body>  
<h1>This is heading 1</h1>  
<h2>This is heading 2</h2>  
<h3>This is heading 3</h3>  
<h4>This is heading 4</h4>  
<h5>This is heading 5</h5>  
<h6>This is heading 6</h6>  
</body>  
</html>
```

OUTPUT:

This is heading 1

This is heading 2

This is heading 3

This is heading 4

This is heading 5

This is heading 6

AIM:Create a HTML page using format tags.

DESCRIPTION:

- There are almost 14 options available that how text appears in HTML.
- In the HTML formatting tags are divided into two categories:physical and logical tags.
- HTML formatting tags allow us to style text without using CSS.

SYNTAX:

<center>...content...</center>
...content ...

<u>...content ... </u>
<strike>...content ... </strike>
^{...content ...}
_{...content ...}
....content..
<ins>...content ...</ins>
<big>...content ...</big>
<small>...content ...</small>
...content ...
<tt>...content ...</tt>
<q>...content ...</q>
...content ...

PROGRAM:

```
<html>
<title>
Format Tags
</title>
<body>
<center>
This is using center tag<br/>
</center>
<b>This is bolded para</b><br/>
<u>This is underlined para</u><br/>
<del>This is striked para</del><br/>
For SuperScript:
a<sup>2</sup><br/>
For SubScript:
a<sub>2</sub><br/>
<del>Striked text using del</del><br/>
<ins>Underlined using ins</ins><br/>
<big>Bigger text</big><br/>
<small>Smaller text</small><br/>
<strong>Bold text using strong</strong><br/>
<tt>Making Characters same height and size</tt><br/>
<q>Adding quotation marks using q tag</q><br/>
<em>Emphasized text using em</em><br/>
</body>
</html>
```

OUTPUT:

This is using center tag

This is bolded para
This is underlined para
~~This is striked para~~
For SuperScript: a²
For SubScript: a₂
~~Striked text using del~~
Underlined using ins
Bigger text
Smaller text
Bold text using strong
Making Characters same height and size
“Adding quotation marks using q tag”
Emphasized text using em

AIM: Create a HTML page using style attributes.

DESCRIPTION:

- In HTML, the style attribute is used to apply inline CSS (Cascading Style Sheets) to individual HTML elements.
- It allows you to define specific styles for an element directly within the HTML tag. Here's a basic description of the style attribute.

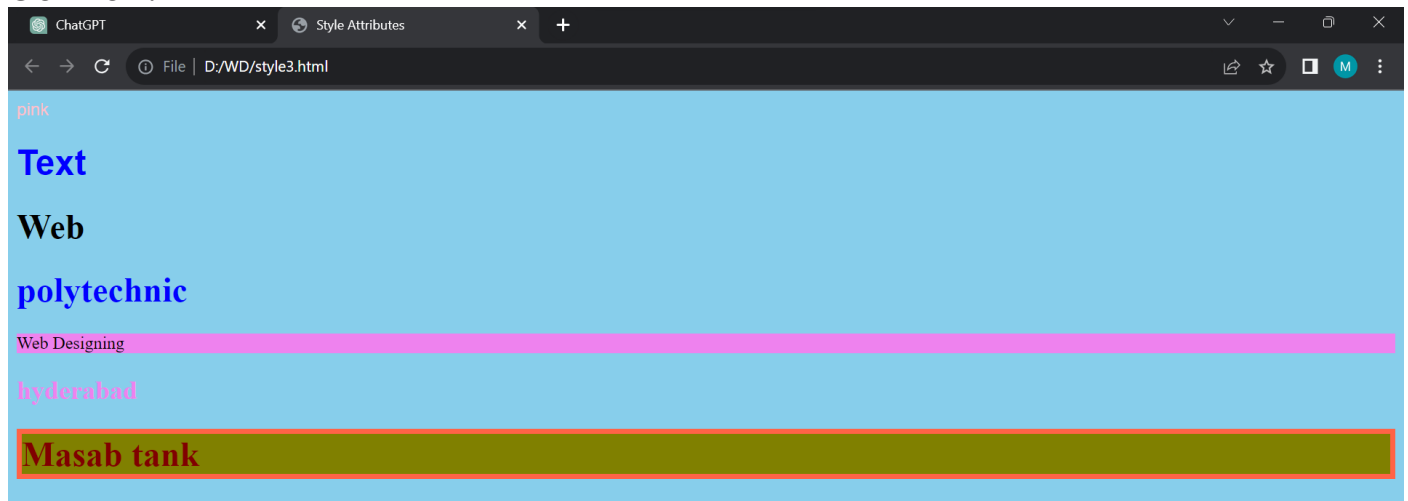

SYNTAX:

`<element style="property: value;">`

PROGRAM:

```
<html>
<title>
Style Attributes
</title>
<body style="background-color:skyblue;">
<p style="font-family:arial;color:pink">pink</p>
<h1 style="font-family:arial;color:blue">Text</h1>
<h1 style="font-size:200%;align:"left";color:white">Web</h1>
<h1 style="color:RGB(0,0,255)">polytechnic</h1>
<p style="background-color:violet" >Web Designing</p>
<h2 style="color:#EE82EE">hyderabad</h2>
<h1 style="border:5px solid tomato; background-color:olive;color:maroon">Masab
tank</h1>
</body>
</html>
```

OUTPUT:

AIM:Create a HTML page using anchor tags.

DESCRIPTION:

- In HTML, an anchor tag, often referred to as the <a> tag, is used to create hyperlinks
- It allows users to navigate from one web page to another or to different sections within the same page

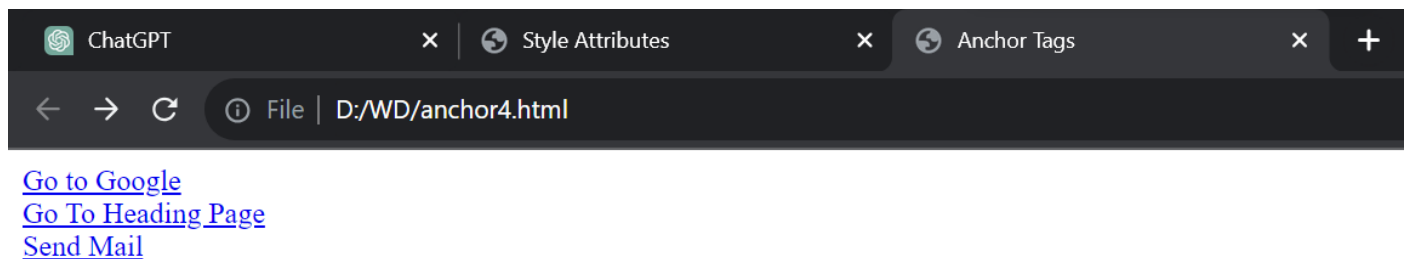

SYNTAX:

```
<a href="destination_url">Link Text</a>
```

PROGRAM:

```
<html>
<title>
Anchor Tags
</title>
<body>
<a href="www.google.com" alt="GooglePage" target="_blank">Go to Google</a><br/>
<a href="heading1.html" alt="FileNotFound" target="_parent">Go To Heading
Page</a></br >
<a href="Mail to:masabtank@gmail.com " target="_self">Send Mail</a><br/>
</body>
</html>
```

OUTPUT:

AIM:Create a HTML page using marquee tags.

DESCRIPTION:

- Marquee tags is used to display scrolling text or image in webpages.
- It has four directions contains:right,left,top,bottom.

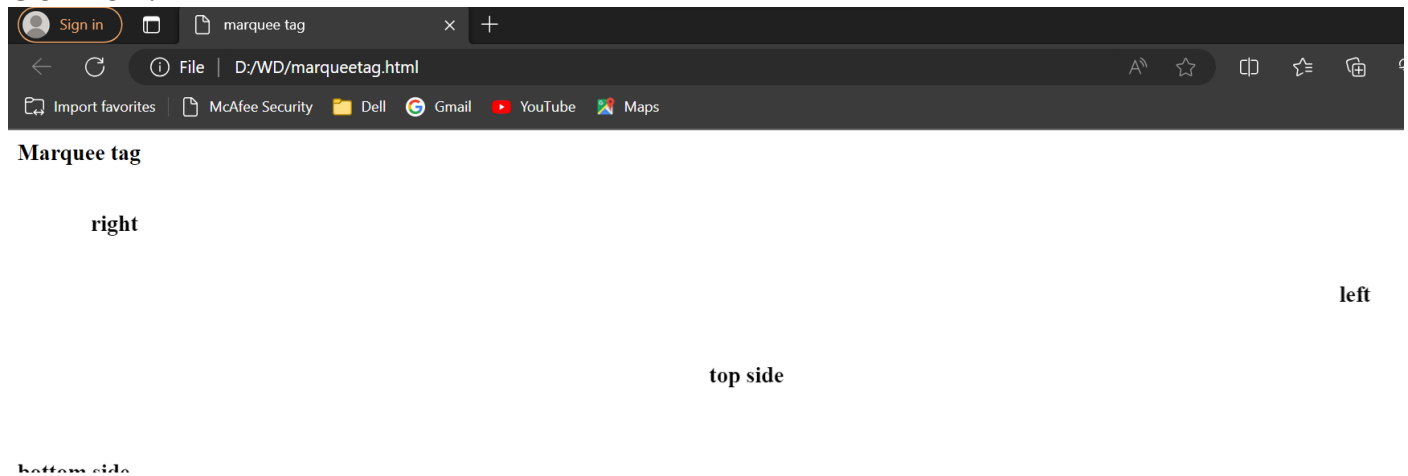

SYNTAX:

`<marquee direction="..">...content...</marquee>`

PROGRAM:

```
<html>
<head>
<title>marquee tag</title>
</head>
<body>
<h3>Marquee tag</h3>
<marquee direction="right"><h3>right</h3></marquee>
<marquee direction="left"><h3>left</h3></marquee>
<marquee direction="up"><h3><center>top side</center></h3></marquee>
<marquee direction="down"><h3>bottom side</h3></marquee>
</body>
</html>
```

OUTPUT:

AIM:Create a HTML page using table tags.

DESCRIPTION:

- The table tag defines a HTML table.
- And HTML table consists of one <table> element and one or more <tr>,<th> and <td> elements.
- An HTML table may also include <caption>,<colgroup>,<thead>,<tbody>and<tfoot>

SYNTAX:

```
<table>
  <tr>
    <th>...content ...</th>
    <td>...content ...</td>
  </tr>
</table>
```

PROGRAM:

```
<html>
<head>
<title>Table tags</title>
</head>
<body>
<caption>BASIC TABLE TAG</caption>
<table border=2>
<thead style="background-color:skyblue">
<tr>
<th>PIN NO</th>
<th>NAME</th>
<th>AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>107</td>
<td>ABC</td>
<td>18</td>
</tr>
<tr>
<td>108</td>
<td>XYZ</td>
<td>18</td>
</tr>
</tbody>
</table>
</body>
</html>
```

OUTPUT:

AIM:Create a HTML page to create Diploma Memo.

DESCRIPTION:

- The table tag defines a HTML table.
- And HTML table consists of one <table> element and one or more <tr>,<th> and <td> elements.
- An HTML table may also include <caption>,<colgroup>,<thead>,<tbody>and<tfoot>

SYNTAX:

```
<table>
  <tr>
    <th>...content ...</th>
    <td>...content ...</td>
  </tr>
</table>
```

PROGRAM:

```
<html>
<head>
<title>Diploma Results</title>
</head>
<body>

```

```
<center><h1>STATE BOARD OF TECHNICAL EDUCATION AND TRAINING
<br>TELANGANA</h1></center>
```

```
<center><h1 style="color:green">MARKS CARD APR-2023</h1></center>

AIM:Create a HTML page to prepare a registration form using all form elements including all possible attributes.

DESCRIPTION:

- HTML provides various form elements that allow users to input data and interact with web applications.
- These form elements are essential for creating web forms, such as contact forms, login pages, and search boxes.

SYNTAX:

Text Input: <input type="text" ...content...>

Password Input: <input type="password" ...content...>

Textarea: <textarea ...content...></textarea>

Radio Buttons: <input type="radio" ...content...>

Checkboxes: <input type="checkbox" ...content...>

Dropdown Select: <select ...content...></select>

File Input: <input type="file" ...content...>

Buttons:

Submit: <button type="submit" ...content...></button>

Reset: <button type="reset" ...content...></button>

Custom: <button type="button" ...content...></button>

Hidden Input: <input type="hidden" ...content...>

Date Input: <input type="date" ...content...>

Email Input: <input type="email" ...content...>

Number Input: <input type="number" ...content...>

Color Input: <input type="color" ...content...>

PROGRAM:

```
<html>
```

```
<head>
```

```
<title>
```

```
Registration form
```

```
</title>

AIM: Desing a college website using html frames

DESCRIPTION:

- HTML frames were a technique used to create a web page layout consisting of multiple independent sections, or frames, within a single browser window.
- Each frame could load a separate HTML document or webpage, allowing developers to create layouts with multiple panes or sections, each displaying distinct content.

SYNTAX:

```
<frameset cols/rows="25%,75%">
  <!-- First Frame -->
  <frame src="frame_name1.html" name="frame_name">
  <!-- Second Frame -->
  <frame src="frame_name2.html" name="frame_name">
  <!-- No Frames Message -->
</frameset>
```

PROGRAM:

AIM: Create a html page on inline css .

DESCRIPTION:

- Inline CSS, also known as inline styles, is a method of applying CSS (Cascading Style Sheets) directly to individual HTML elements.
- Unlike external or internal CSS, which separate the styling instructions from the HTML content, inline CSS places the style rules directly within the HTML element's tag.

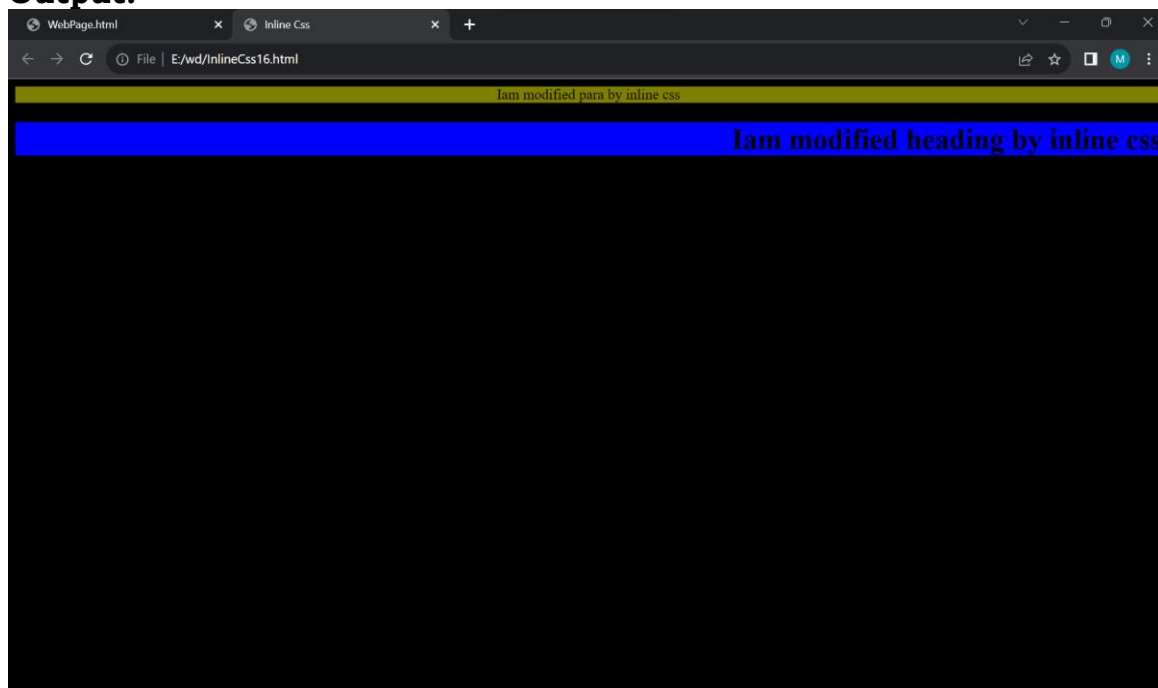

Syntax:

```
<element style="property1: value1; property2: value2; ...">  
Content  
</element>
```

Program:

```
<html>  
<head>  
<title>  
Inline Css  
</title>  
</head>  
<body style="background-color:black">  
<p style="background-color:olive;text-align:center;size:25px">Iam modified para by inline  
css</p>  
<h1 style="text-align:right;background-color:blue;">Iam modified heading by inline  
css</h1>  
</body>  
</html>
```

Output:

AIM: Create a html page on internal css .

DESCRIPTION:

- Internal CSS, also known as embedded CSS, is a method of adding CSS styling rules directly within an HTML document.
- Unlike external CSS (which uses separate .css files) or inline CSS (which applies styles directly to individual HTML elements), internal CSS is placed within the <style> element within the HTML document's <head> section.

Syntax:

```
<html>
<head>
  <style>
    /* CSS rules go here */
    elements{
      /*content*/
    }
  </style>
</head>
</html>
```

Program:

```
<html>
<head>
<title>
Internal Css
</title>
<style>
div p{
background-color:blue;
size:15px;
}
.center{
color:red;
text-align:center;
}
</style>
</head>
<body>
<p>Iam Not Effecting para by div</p>
<div>
<p>Iam Effecting para by div</p>
</div>
<h1 class="center">Effecting heading by center</h1>
<h1>Not Effecting heading</h1>
</body>
</html>
```

Output:

Iam Not Effecting para by div

Iam Effecting para by div

Effecting heading by center

Not Effecting heading

AIM: Create a html page on extenal css .

DESCRIPTION:

- External CSS (Cascading Style Sheets) is a method of styling web content where the CSS rules are defined in a separate external file with a .css extension.
- This approach allows you to keep the presentation (styling) separate from the content (HTML), making your code more organized and maintainable.

Syntax:

<!--In html code -->

```
<link rel="stylesheet" type="text/css" href="styles.css">
```

```
/* styles.css */
```

```
element {  
    /*content*/  
}
```

```
Other elements {  
    color: #333;  
}
```

Program:

```
<html>  
<head>  
<title>  
External Css  
</title>  
<link rel="stylesheet" type="text/css"href="stylee.css">  
</head>  
<body>  
<p>Para effecting with external css</p>  
<h1>Heading effecting with external css</p>  
</body>  
</html>
```

stylee.css

```
body{  
background-color:black;  
}  
p{  
text-align:center;  
color:maroon;  
margin-left:40px;  
}  
h1{  
text-align:right;  
color:yellow;  
}
```

Output:

AIM: Create a html page on inline,internal and external mixture use all maximum attributes and properties and selectors.

Syntax:

```
<html>
<head>
  <style>
    elements{
      /*content*/
    }
  </style>
  <link rel="stylesheet" type="text/css" href="styles.css"> <!-- internal css -->
</head>
<body>
  <element style="property1: value1; property2: value2; ...">
    Content
  </element> <!-- inline css -->

</body>
</html>
```

```
/* styles.css */
/*external css*/
```

```
element {
  /*content*/
}
Other elements {
  color: #333;
}
```

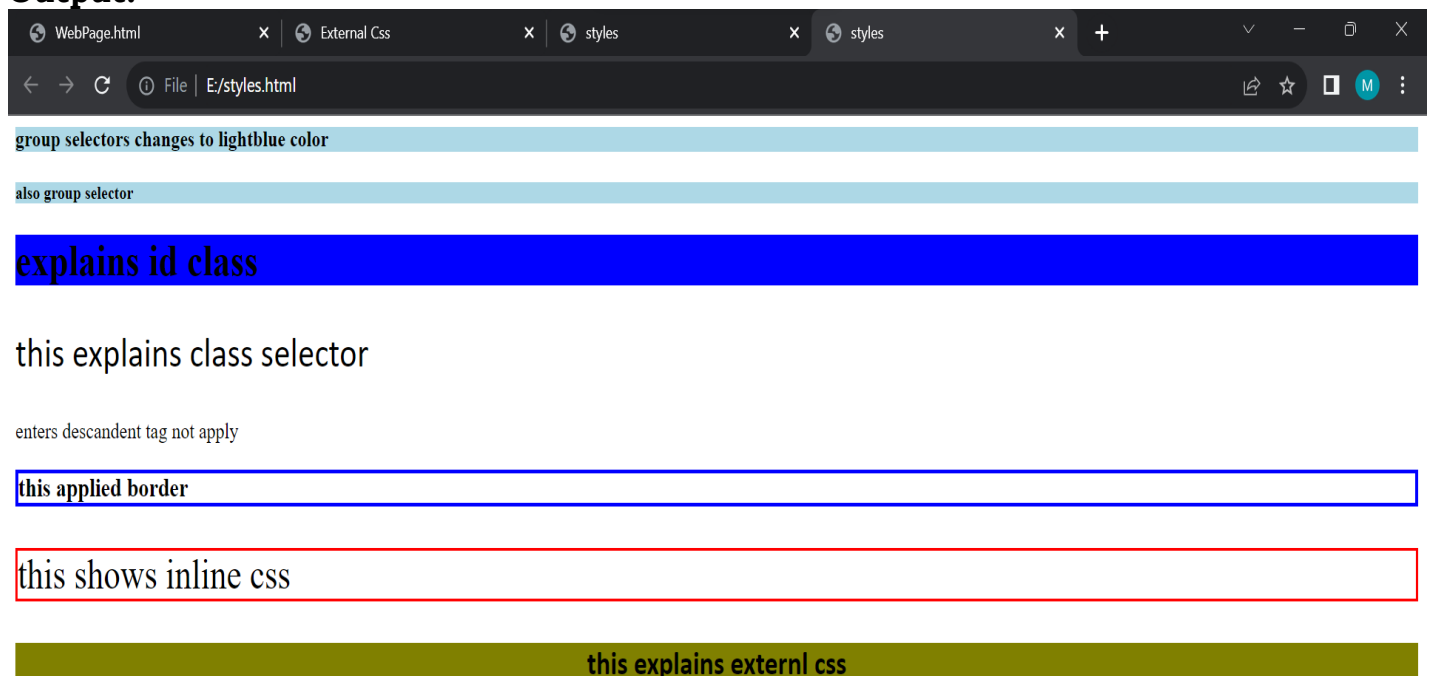

Program:

```
<html>
<head>
<title>styles</title>
<style>
#v
{background-color:blue;}
.class
{font-size:30px;
font-family:calibri;
}
div h3{
border:3px solid blue;
}
h4,h5{
background-color:lightblue;
}
```

```
</style>
<link rel="stylesheet" type="text/css" href="mystyle.css">
</head>
<body>
<h4>group selectors changes to lightblue color</h4>
<h5>also group selector</h5>
<h1 id="v">explains id class</h1>
<p class="class">this explains class selector</p>
<div>
<p>enters descendant tag not apply</p>
<h3>this applied border</h3>
</div>

<p style="font-size:30px;border:2px solid red">this shows inline css</p>
<h2 class="ex">this explains external css</h2>
</body>
</html>
mystyle.css
h2{
border-left:2px;
background-color:olive;
text-align:center;
font-family:calibri;
}
```

Output:

AIM: Create a html page on border style properties.

DESCRIPTION:

- Selectors in HTML are patterns or rules used to target and style specific HTML elements within a web page. They are an essential part of CSS (Cascading Style Sheets) and are used to define which elements should receive certain styles.
- Selectors are used to specify which elements in the HTML document should be affected by the CSS rules you define.

Syntax:

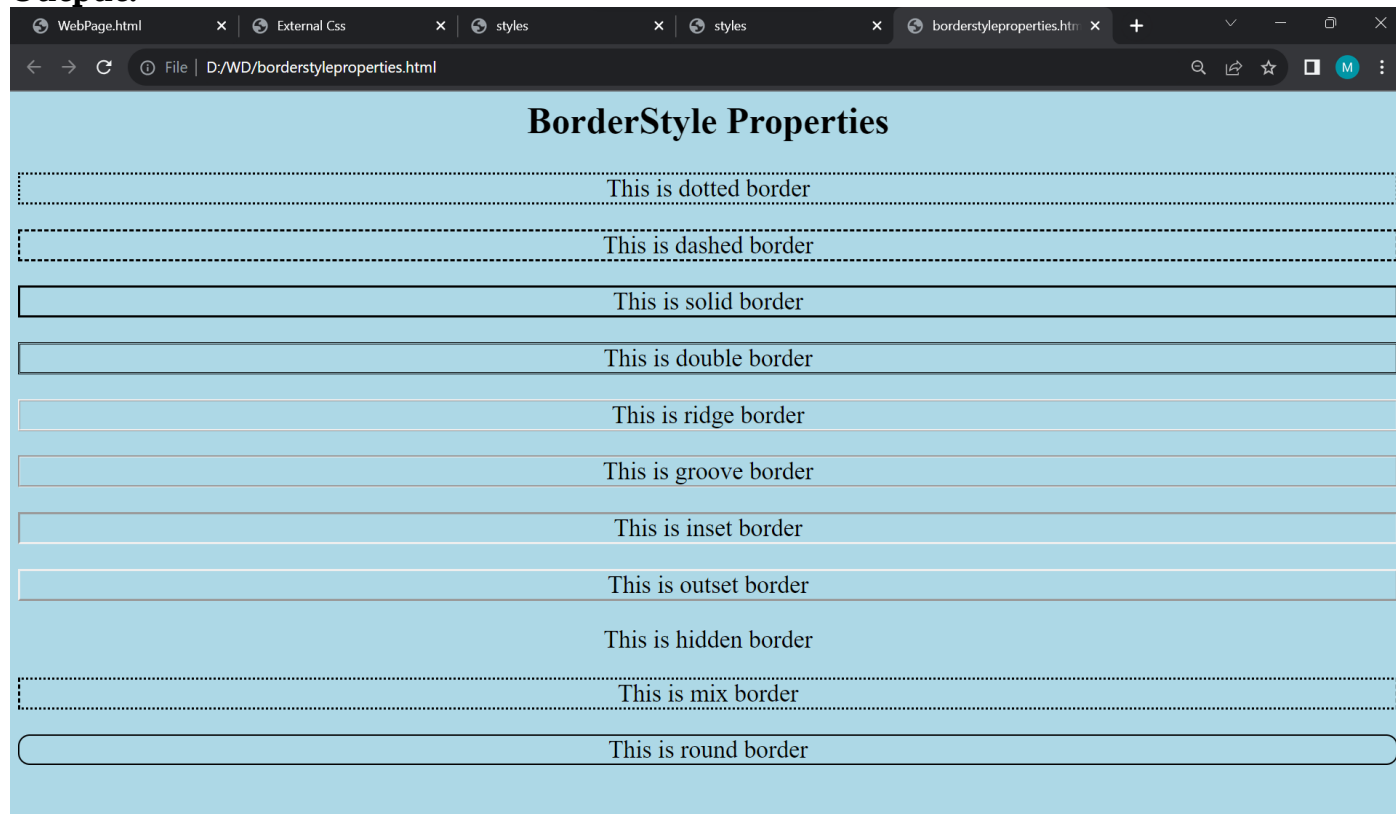

Program:

```
<html>
<head>
<style>
body
{
background-color:lightblue;
text-align:center;
font-family:BookManOldStyle;
font-weight:lighter;
font-size:25px;
}
p.solid{border-style:solid;}
p.double{border-style:double;}
p.groove{border-style:groove;}
p.ridge{border-style:ridge;}
p.inset{border-style:inset;}
p.outset{border-style:outset;}
p.mix{border-style:dotted dashed;}
p.hidden{border-style:hidden}
p.round{border:2px solid black;
        border-radius:12px;}

</style>
</head>
<body>
<h2>BorderStyle Properties</h2>
<p style="border-style:dotted">This is dotted border</p>
<p style="border-style:dashed">This is dashed border</p>
<p style="border-style:solid">This is solid border</p>
<p class="double">This is double border</p>
<p class="ridge">This is ridge border</p>
<p class="groove">This is groove border</p>
<p class="inset">This is inset border</p>
<p class="outset">This is outset border</p>
<p class="hidden">This is hidden border</p>
<p class="mix">This is mix border</p>
<p class="round">This is round border</p>
</body>
```

</html>

Output:

AIM:Create a HTML page using Nested Ordered List using css.

DESCRIPTION:

- Ordered List helps us to create a sequence of text.
- It has 5 types:A,a,I,i,1

SYNTAX:

```
<ol type="list_type">
    <ol type="list_type">
        <li>...some text...</li>
        ....
    </ol>
</ol>
```

PROGRAM:

```
<html>
<head>
<title>nestedorderedlist</title>
<style>
body
{
    font-family:BookManOldStyle;
    font-size:30;
    font-weight:bold;
    color:orange;
}

</style>
</head>
<body>
<h3>Nested Ordered List</h3>

AIM: Create a html page on nested unordered list using css .

DESCRIPTION:

- unordered List helps us to create a sequence of text.
- It has different types:circle,disc,square,none,images etc.

SYNTAX:

```
<ul type="list_type">
    <ul type="list_type">
        <li>...some text...</li>
        ....
    </ul>
</ul>
```

Program:

```
<html>
<head>
    <title>nestedcss</title>
    <style>
        .c{
            padding-left: 30px;
            background-image: url("MyPhoto.jpg");
            background-size: 16px 16px;
            background-repeat: no-repeat;
        }
        body
        {
            font-family:BookManOldStyle;
            font-size:30;
            font-weight:bold;
            color:orange;
        }
    </style>
</head>
<body>
    <h1>Custom List </h1>
    <ul type=none>
        <li class="c">Item 1</li>
        <li class="c">Item 2</li>
            <ul style="list-style-type:circle">
                <li>sub-item1</li>
                <li>sub-item2</li>
                <ul style="list-style-type:disc">
                    <li>name of the item</li>
                    <li>cost of the item</li>
                    <li>expiry date</li>
                </ul>
                <li>sub-item3</li>
            </ul>
        <li class="c">Item 3</li>
```

```
</ul>  
</body>  
</html>
```

Output:

Custom List

Item 1

Item 2

- **sub-item1**
- **sub-item2**
 - **name of the item**
 - **cost of the item**
 - **expiry date**
- **sub-item3**

Item 3

AIM: Create a html page on nested ordered and unordered list using css .

DESCRIPTION:

- Ordered List and Unordered List helps us to create a sequence of text.
- This makes the webpage content clear and ordered manner

SYNTAX:

```
<ul type="list_type">
    <ol type="list_type">
        <li>...some text...</li>
        ....
    </ol>
    <li>...some text...</li>
    ....
    <ul type="list_type">
        <li>...some text...</li>
        ....
    </ul>
</ul>

AIM: Create a html page on ssc short memo using css.

Description:

- CSS stands for cascading style sheets .it is a style sheet language used in web development to describe the presentation and formatting of a document written in html.
- CSS allows the web designers and developers to control the layout design,colors,fonts,and other visual aspects of a web page.

Program:

```
<html>
<head>
<title>memo</title>
<STYLE>
body,form{
BACKGROUND-COLOR:lightpink;
}
.b
{
BACKGROUND-COLOR:LIGHTPINK;
}
div fieldset,pre{
BACKGROUND-COLOR:saffron;
font-family:calibri;
}
</STYLE>
</head>
<body>

QR CODE2

AIM: Create a html page using all css possible colors.

DESCRIPTION:

- In CSS (Cascading Style Sheets), you can specify colors using various methods, including color names, hexadecimal values, RGB values, RGBA values, HSL values, and HSLA values.

SYNTAX:

```
.heading {  
    color: blue;  
}
```

PROGRAM:

```
<html>  
<head>  
<title>colors</title>  
<style>  
.x1{  
    background-color:rgb(225,0,0);  
    color:#ffffff;  
  
}  
.x2{  
    background-color:rgba(125,100,0,0.5);  
}  
.x3{  
    background-color:hsl(225,95%,60%);  
}  
.x4{  
    background-color:hsla(225,65%,30%,0.3);  
}  
</style>  
</head>  
<body>  
<p class="x1">this contains rgb color</p>  
<p class="x2">this contains rgba color</p>  
<p class="x3">this contains hsl color</p>  
<p class="x4">this contains hsla color</p>  
</body>  
</html>
```

OUTPUT:

AIM: Create a html page using links css.

DESCRIPTION:

- In CSS, you can style links (hyperlinks) using various pseudo-classes and properties to control their appearance and behavior.

SYNTAX:

```
/* Unvisited link */
a:link {
    ... content...
}
/* Visited link */
a:visited {
    ... content...
}
/* Mouse-over effect */
a:hover {
    ... content...
}
/* While being clicked */
a:active {
    ... content...
}
```

Program:

```
<html>
<head>
<style>
body
{
font-size:25px;
font-weight:bold;
}
a:link
{
color:maroon;
text-align:center;
display:inline_block;
font-style:BookManOldStyle;
}
a:visited
{
color:green;
text-align:center;
font-family:arial;
}
a:hover
{
background-color:pink;
font-family:cilibr;
}
```

```
a:active
{
background-color:lightblue;
font-family:TimesNewRoman;
}
</style>
<body>
